Project Overview

Navigating the TV future

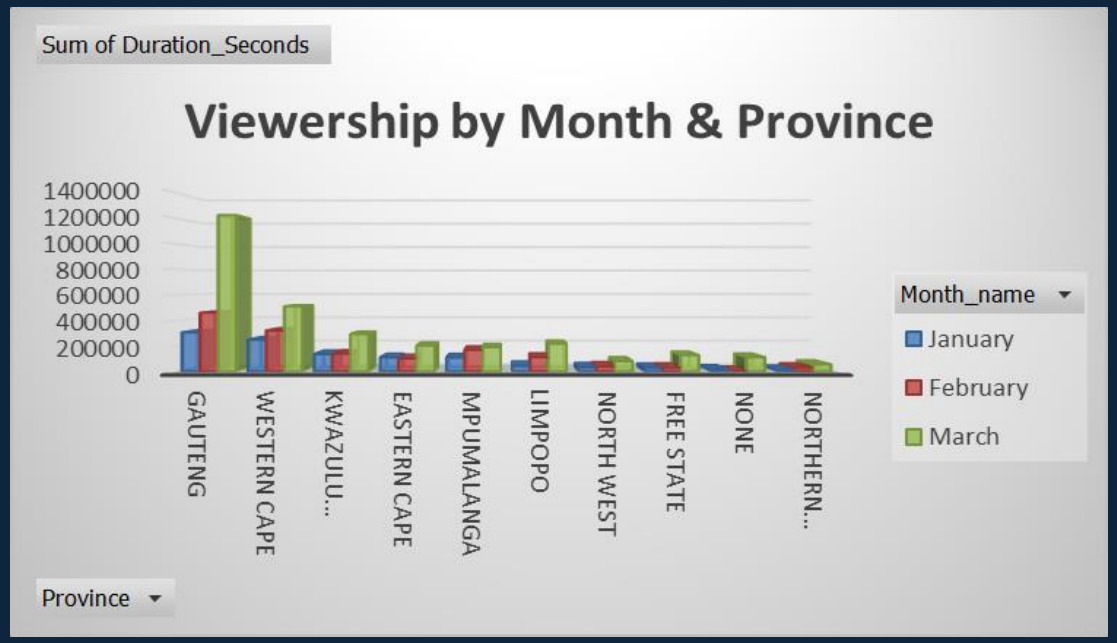
The primary objective of this project is to support BrightTV's CVM team in achieving the CEO's goal of increasing the subscriber base. To accomplish this, we analysed user profile and viewership data to identify key factors influencing viewing behaviour.

From a technical perspective, Databricks was used to integrate and clean the datasets, including converting session timestamps from UTC to South African time to ensure accurate analysis of local trends. Through data analysis techniques such as pivot tables, we uncovered viewing patterns, identified low-engagement periods, and developed targeted content and growth strategies aimed at improving user engagement and attracting new subscribers.

Trend Analysis

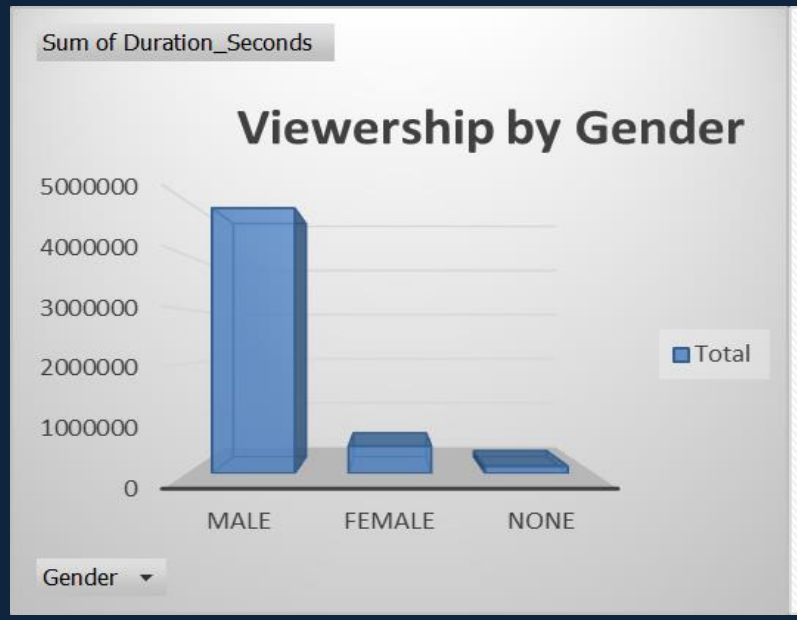
Content & Time

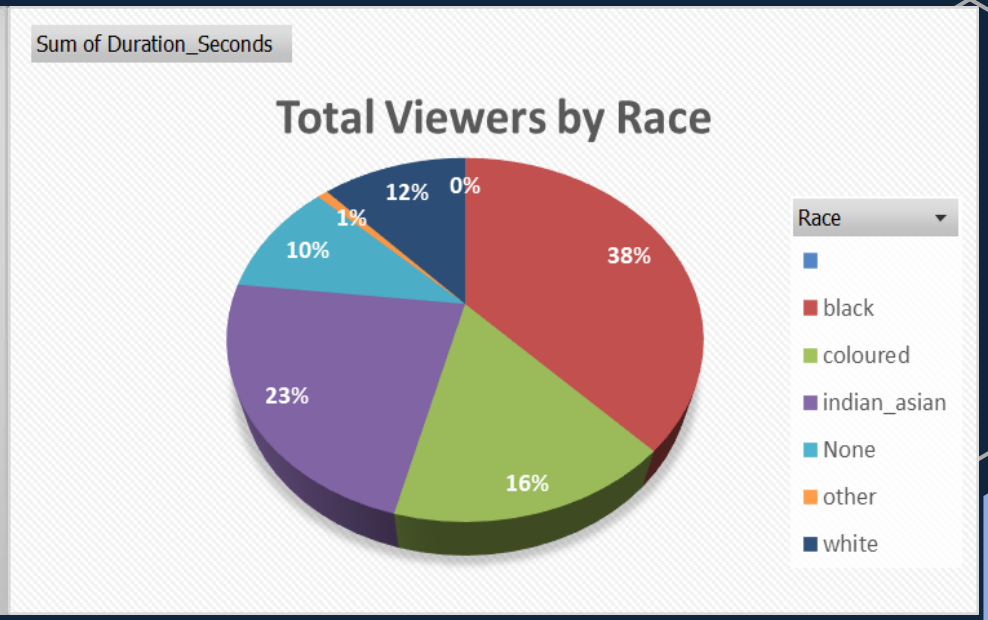
Monthly Viewership Trends by Province



- There is a massive, platform-wide surge in viewership duration during March across all provinces, indicating a strong upward trajectory in user engagement as the first quarter progressed.
- Gauteng and the Western Cape are the primary drivers of consumption, with Gauteng alone contributing nearly double the watch time of any other province, particularly during the March peak.

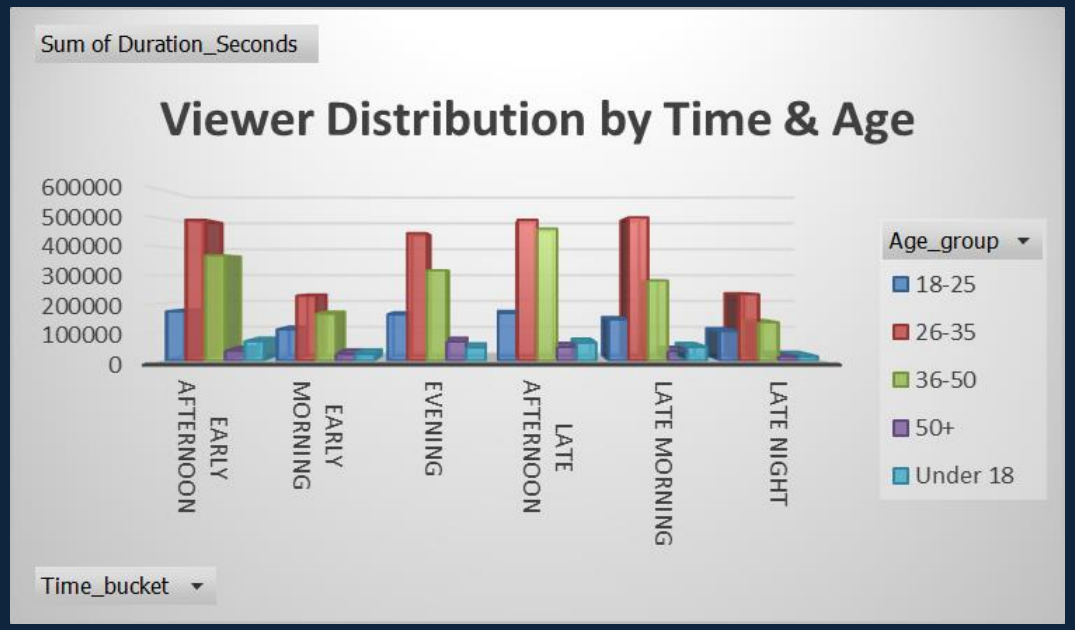
Viewership Distribution by Gender & Race





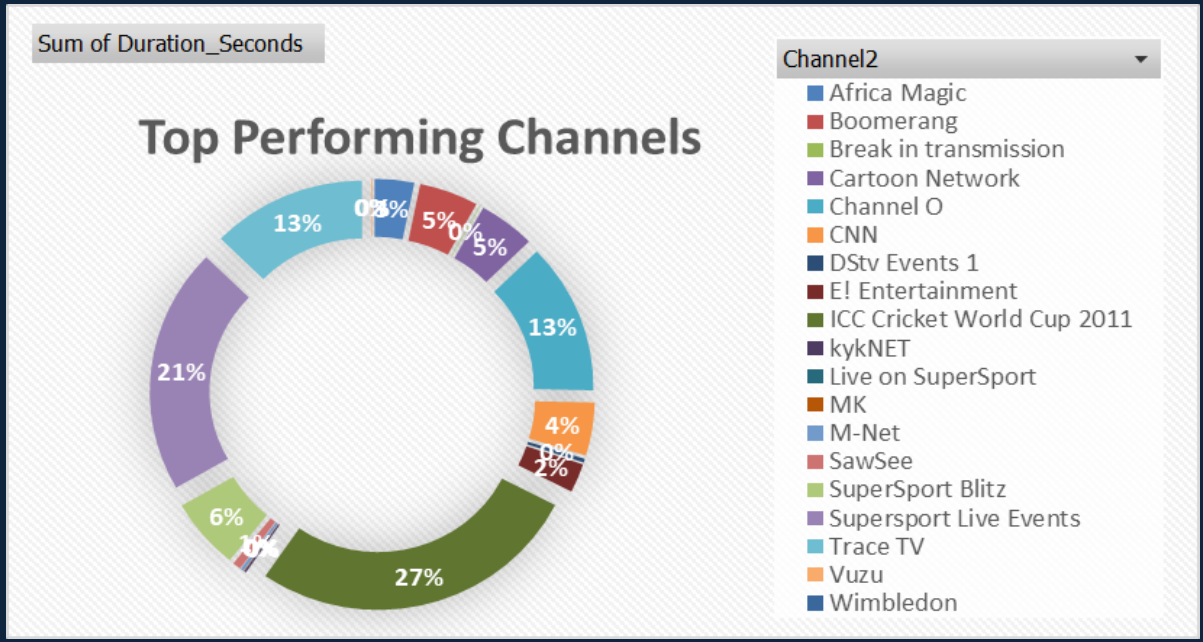
- Male viewers dominate the platform's consumption, accounting for over 4,000,000 seconds of watch time, which is roughly 8 times higher than female viewership. This suggests a major opportunity for the CVM team to grow the subscriber base by introducing content specifically tailored to female audiences.
- Consumption is highest among the Black (38%) and Indian/Asian (23%) demographics, showing that current content resonates well with these groups. The Coloured (16%) and White (12%) segments follow, indicating a relatively broad appeal across different racial backgrounds.
- The low viewership among females and certain racial segments (such as the "Other" category at 1%) highlights clear "gaps" in the market.

Viewership Trends by Time Interval and Age Group



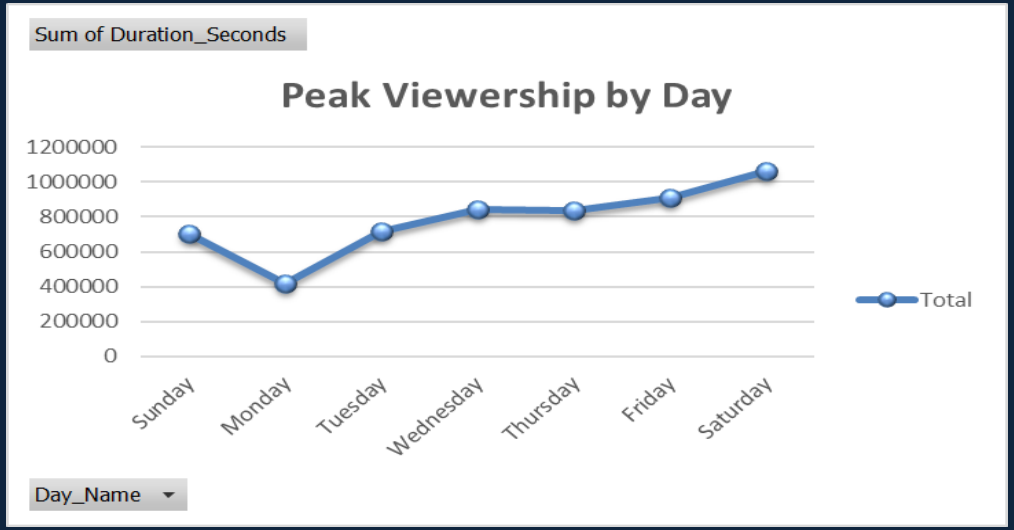
- The 26–35 age group is BrightTV's most active segment, showing consistently high consumption throughout the day, with major peaks during the morning, late morning, and late afternoon.
- High-engagement "prime time" occurs during the Early Afternoon, Late Afternoon, and Late Morning, driven largely by the 26–35 and 36–50 age groups.
- Consumption drops significantly during Early Morning and Late Night across all demographics. This identifies a clear opportunity for the CVM team to schedule "binge-worthy" content or notifications to spark activity during these quiet periods.
- Viewers Under 18 and 50+ show the lowest engagement overall. To meet the CEO's growth objectives, BrightTV could introduce targeted initiatives—such as educational/kids' programming for the youth or specialized news/lifestyle content for seniors—to diversify and grow the user base.

Channel Performance Analysis



- Sports content is the primary driver of viewership, with SuperSport Live Events (21%) and the ICC Cricket World Cup 2011 (27%) collectively accounting for nearly half of all consumption duration.
- Music and lifestyle channels like Channel O (13%) and Trace TV (13%) show significant engagement, suggesting a strong youth or young-adult audience base within the current subscriber mix.
- Traditional entertainment and news channels such as Africa Magic (3%), CNN (4%), and E! Entertainment (2%) have lower relative viewership, indicating an opportunity to either boost their promotion or rethink the content mix in these categories.
- The high percentage for specific events (like the Cricket World Cup) highlights that BrightTV's consumption is highly influenced by "appointment viewing," which can be used by the CVM team to plan targeted acquisition campaigns around major global spectacles

Peak Viewership by Day



- Monday is the day with the lowest consumption, showing a significant drop compared to the rest of the week. This represents a critical opportunity for the CVM team to introduce "Monday-only" content releases or push notifications to spark engagement.
- Consumption climbs steadily throughout the week, reaching its absolute peak on Saturday. This suggests that users have more leisure time on weekends, making it the ideal window for premium content premieres or big-budget live events.
- Following the Monday dip, viewership recovers and remains relatively stable from Wednesday through Friday. This indicates a consistent routine for the core audience, which can be leveraged for episodic content that keeps users coming back daily.

Strategic Recommendations

Increase Consumption (Low-Day Focus)

- "Monday Night Movies" or Series Premieres: Launch high-demand exclusive series or blockbuster movies on Monday nights to counteract the weekly consumption dip.
- Catch-Up & Highlight Reels: Use the low-consumption morning periods to stream "Weekend Rewinds," featuring highlights from Saturday's peak sports and music events.
- Time-Sensitive Interactive Contests: Introduce live polls or mobile-integrated quizzes during early morning and late-night slots to incentivize "off-peak" viewing.
- Strategic Push Notifications: Deploy personalized CVM (Customer Value Management) alerts on Monday afternoons to remind users of trending content, specifically targeting the highly active 26–35 age demographic.

Strategic Initiatives to Grow the User Base

- Diversify Content Portfolio (Gender-Focused): Develop and promote content specifically curated for female audiences to bridge the current 8:1 consumption gap between male and female viewers.
- Localised Content for Emerging Provinces: Launch "Hyper-Local" marketing and content initiatives in provinces like the Free State and Northern Cape to capture underpenetrated markets outside of Gauteng.
- Referral & Loyalty Incentives: Implement a "Refer-a-Friend" program tailored for the core 26–35 demographic in Gauteng, leveraging the existing loyal base to drive new organic subscriptions.
- Data-Lite Viewing Options: Introduce lower-bitrate streaming tiers to lower the barrier for entry in regions where high-speed internet infrastructure may be limited.

Conclusion

The analysis shows that BrightTV is experiencing steady growth in viewership over time. Using Databricks and localised timestamps, we identified key patterns in audience behaviour across regions and demographics.

While Gauteng and male viewers form the core audience, there are clear opportunities to grow in other regions and among different groups. Low engagement periods, such as Mondays, highlight areas for targeted content strategies. Overall, these insights provide a data-driven approach to increasing engagement and expanding the subscriber base
